Q.1. Draw and explain the Cloud Reference Model with its layers.

Ans→ Physical Infrastructure layer (Bottom layer)

Components :-

i) Server :- Physical Computing Machines (Rack servers blade servers)

ii) Storage Systems :- SAN, NAS, DAS storage arrays

iii) Network Equipments :- Routers, Switches, firewalls, load balancers.

iv) Data Center Facilities :- Buildings, power supply, cooling, physical security.

Characteristics :-

i) Foundation of cloud Computing

ii) High Capital investment required.

iii) Geographically distributed across regions and availability zones.

iv) Provides raw Computing resources.

Example :- AWS Data Centers with thousands of physical servers across 25+ geographic regions.

② Virtualization and Management Layer (Middle Layer)
This layer abstracts physical resources and provides Management Capabilities.

A) Resource Management
i) Virtualization :- Creates virtual Machine, virtual storage, virtual Networks.
ii) Resource pooling :- Combines physical resources into shared pool.
iii) Dynamic Allocation :- Assigns resources on-demand.
iv) Load Balancing :- Distributed WorkLoads across multiple Servers.

B) Service Management
i) orchestration : Automated deployment and Management of services.
ii) provisioning :- Rapid allocation of resources to users.
iii) Service Catalog :- predefined service templates
iv) WorkFlow Automation :- Streamlines operational process.

c) Security Management
i) Access Control :- User authentication and authorization
ii) Encryption :- Data protection at rest and in transit

iii) Complience :- Adherence to regulatory standard.
iv) Network security :- Firewalls, intrusion detection systems.

③ Cloud Service Models Layer (Top Layer)

A) Iaas (Infrastructure as a Service)
i) Providers : virtualized Computing resources over the internet
ii) User Controls :- OS, applications, data, runtime environment.
iii) Provider Manages :- Virtualization, servers, storage, networking
Example :-
AWS EC2 :- Virtual server
Azure Virtual Machine :- Scalable Computing
Google cloud storage :- object storage.

B) Paas (Platform As a Service)
i) Provides : Development and deployment platform
ii) User Controls :- Application and data only
iii) Provider Manages :- Runtime, middleware, OS, infrastructure.

Examples :-

Heroku :- Applications deployment platform.
Google app Engine :- Web application hosting
AWS Elastic Beanstalk :- Automated deployment.

c) SaaS (software as a service)

Provides :- Ready-to-use software applications
User controls :- Nothing
Provider Manages :- Everything from application to infrastructure

Example :-

Google workspace :- productivity suite
Salesforce : CRM software
Microsoft office 365 :- office applications.

Q.2 Differentiate between public, private, Hybrid, and Community clouds with example :-

① Public cloud

Definition :- Cloud services offered to multiple customers over the public internet by third-party provider.

Key characteristics :-

i) Multi Tenancy :- Multiple organizations share same infrastructure.

ii) Cost effective :- No upfront investment, pay-per-use model.

iii) Managed by :- Cloud service providers

iv) Locations :- off-premises, provider's data Centre.

Advantages :-

i) No Capital investment

ii) Unlimited Scalability

iii) Automatic updates and Maintenance

iv) Global accessibility.

Disadvantages :-

i) Limited Customization

ii) Potential security concerns

iii) Less Control over infrastructure

iv) Data Redundancy issues.

Example :-

Amazon Web Services (AWS) :- EC2, S3 services.

Microsoft Azure.

Google Cloud Platform.

Salesforce.

KOLHAPUR INSTITUTE OF TECHNOLOGY'S
College of Engineering Kolhapur
(Empowered Autonomous)
Accredited A+ Grade by NAAC with CGPA 3.33

② Private cloud.

Definition:- Cloud infrastructure dedicated to a single organization, either on-premises or hosted by third party.

Key characteristics:-

i) Single Tenancy :- Exclusive use by one organization.
ii) High security :- Complete control over data and security
iii) Managed by :- organization or Managed service provider
iv) Location : on-premise or hosted.

Advantages:-

i) Enhanced security and privacy
ii) Customizable to specific needs
iii) Better Regulatory Compliance
iv) Full Control over resources.

Disadvantages:-

i) High initial investment
ii) Limited scalability
iii) Requires in-house expertise
iv) Maintenance overhead.

Example:- VMware VSphere, openstack, Microsoft Azure stack.

③ Hybrid cloud

Definition :- Combination of public and private cloud that remain distinct entities but are bound together.

Key characteristics :-

i) Workload Portability :- Applications can move between environments.

ii) Flexibility :- Choose best environment for workload.

iii) Burst Capability :- Handles spikes using public cloud.

iv) Data Synchronization :- Consistant data across environmen

Advantages :-

i) Best of both worlds

ii) Cost optimization

iii) Business continuity

iv) Regulatory Compliance flexibility

Disadvantages :-

i) Complex to manage

ii) Integration challanges

iii) Potential latency issues

iv) Higher management overhead.

Example :-

i) AWS Outposts : AWS infrastructure on-premises

ii) Azure Arc : Manages resources across environments.

(4) Community cloud.

Definition:- cloud infrastructure shared by several organisations with common concerns

Key characteristics:-

i) Shared infrastructure:- Multiple organization in same community

ii) Common Goals:- shared compliance, security, policy requirements

iii) Cost sharing:- Expenses distributed among members.

iv) Collaborative Management:- Joint governance model.

Advantages:-

i) Cost effective for community members

ii) Enhanced security for specific industries

iii) shared compliance requirements

iv) Collaborative innovation.

Disadvantages:-

i) Limited to community members

ii) shared responsibility challanges

iii) potential conflicts in governance.

iv) Limited service provider.

Example:-

i) Government Community cloud:- Multiple government agencies sharing infrastructure.

ii) Healthcare Community cloud:- Hospital sharing patient data securely.
